to cut is to humiliate for no particular reason but for the satisfaction of the few that seemed not to show human feelings for those being humiliated allowing genital mutilation to be practiced in any part of the universe is to say that civilization that was fought for by our ancestors has no relevance in today s realism the human body should always be respected and kept whole especially for the fact that it is known biblically that we are created in the image of the almighty god and should not be tampered with under any condition or circumstance just to please the interests of certain class of people hiding behind the rhetoric of cultures and customs only in self realization of their personal satisfaction nothing can compare to the way our children and women are being relegated to the punishment emanating from this inhuman gesture to continue allowing this treacherous ancient act being meted on humans in the 21st century is to make irrelevant and a thing of mockery the entire purpose behind civilization

as anyone who has watched television in recent years can attest we live in the age of viagra from bob dole to mike ditka to late night comedians our culture has been engaged in one long frank and very public talk about impotence and our newfound pharmaceutical solutions but as angus mclaren shows us in impotence the first cultural history of the subject the failure of men to rise to the occasion has been a recurrent topic since the dawn of human culture drawing on a dazzling range of

sources from across centuries mclaren demonstrates how male sexuality was constructed around the idea of potency from times past when it was essential for the purpose of siring children to today when successful sex is viewed as a component of a healthy emotional life along the way impotence enlightens and fascinates with tales of sexual failure and its remedies for example had ditka lived in ancient mesopotamia he might have recited spells while eating roots and plants rather than pills and explanations which over the years have included witchcraft shell shock masturbation feminism and the oedipal complex mclaren also explores the surprising political and social effects of impotence from the revolutionary unrest fueled by louis xvi s failure to consummate his marriage to the boost given the fledgling american republic by george washington s failure to found a dynasty each age mclaren shows turns impotence to its own purposes using it to help define what is normal and healthy for men their relationships and society from marriage manuals to metrosexuals from renaissance italy to hollywood movies impotence is a serious but highly entertaining examination of a problem that humanity has simultaneously regarded as life s greatest tragedy and its greatest joke

sexual mutilation is a global problem that affects 15.3 million children and young adults annually in terms of gender 13.3 million boys and 2 million girls are involuntarily subjected to sexual mutilation every year while it is tempting to quantify and compare the amount of tissue removed from either gender no ethical justification can be made for removing any amount of flesh from the body of another person the violation of human rights implicit in sexual mutilation is identical for any gender the violation occurs with the first cut into another person's body although mutilation is a strong term it precisely and accurately describes a condition denoting any disfigurement or injury by removal or destruction of any conspicuous or essential part of the body while such terms as circumcision and genital cutting are less threatening to our sensitivities they ultimately do a disservice by masking the fact of what is actually being done to babies and children although the courageous example of the survivors of sexual mutilation indicates that humans can certainly live and even reproduce without all of their external sexual organs this biological phenomenon does not however justify subjecting a person to sexual mutilation the remarkable resilience of the human body is a testament to the importance nature places on reproduction rather than a vindication for surgical practices that compromise this function

What is the Fourth Planet in the Solar System?

Our solar system, a fascinating celestial neighborhood, is comprised of a star (the Sun) and a collection of planets, moons, asteroids, and comets. Understanding the characteristics and composition of each planet offers a glimpse into the vastness and complexity of the cosmos. This article will focus on the fourth planet from the Sun: Mars, the "Red Planet." We will explore its physical attributes, atmospheric conditions, potential for life, and its significance in planetary science.

1. Introducing Mars: The Red Planet

Mars, named after the Roman god of war, is the fourth planet from the Sun and the second-smallest planet in our solar system after Mercury. Its reddish appearance, caused by iron oxide (rust) prevalent on its surface, is the reason for its moniker, "the Red Planet." This distinctive color has captivated human imagination for centuries, fueling countless myths, stories, and scientific endeavors aimed at understanding this intriguing celestial body. Unlike the Earth's relatively dense and nitrogen-rich atmosphere, Mars boasts a thin atmosphere, primarily composed of carbon dioxide. This thin atmosphere leads to significant temperature variations and a harsh environment not conducive to liquid water on the surface, at least not currently.

2. Physical Characteristics of Mars

Mars is a terrestrial planet, meaning it is a rocky planet with a solid surface, similar to Earth, Mercury, and Venus. Its diameter is roughly half that of Earth's, and its mass is about 10% of Earth's. This smaller size translates to a weaker gravitational pull, approximately 38% of Earth's gravity. Imagine jumping on Mars – you'd be able to leap significantly higher than on Earth! The surface of Mars is characterized by vast plains, towering volcanoes, deep canyons, and polar ice caps. Olympus Mons, the largest volcano and mountain in our solar system, resides on Mars, standing at an incredible height three times that of Mount Everest. Valles Marineris, a gigantic canyon system, dwarfs even the Grand Canyon, showcasing the dramatic geological processes that have shaped the Martian landscape over billions of years. These features reveal a complex geological history involving volcanic activity, tectonic shifts, and possibly ancient water flows.

3. Martian Atmosphere and Climate

Mars' atmosphere is extremely thin, about 1% the density of Earth's atmosphere at sea level. This thin atmosphere offers little protection from solar radiation and contributes to the planet's frigid temperatures. Average temperatures on Mars hover around -63°C (-81°F), though they can fluctuate significantly depending on location and time of day. The thin atmosphere also means that Mars experiences a much lower atmospheric pressure than Earth, further hindering the existence of liquid water on the surface. The Martian atmosphere is predominantly carbon dioxide (about 95%), with small amounts of nitrogen, argon, and traces of other gases. The presence of water ice in the polar ice caps and subsurface regions suggests that Mars might have once possessed a much denser atmosphere and a warmer climate, potentially capable of supporting liquid water on the surface. This

possibility fuels ongoing research into the planet's past and potential for past or present life.

4. The Search for Life on Mars

The question of whether life ever existed, or even currently exists, on Mars is a central focus of planetary science. Evidence suggests that Mars may have once possessed conditions more conducive to life, including liquid water and a thicker atmosphere. Past missions have discovered evidence of past water flows, such as dried-up riverbeds and mineral deposits that typically form in the presence of water. Current missions like the Perseverance rover are actively searching for signs of past microbial life, analyzing rock and soil samples for organic molecules and other biosignatures. While conclusive evidence of past or present life remains elusive, the possibility remains a potent driver of ongoing exploration.

5. Mars Exploration and Future Missions

Humanity's fascination with Mars has driven numerous robotic missions to explore the planet. Orbiters, landers, and rovers have sent back a wealth of data, revealing details about the planet's geology, climate, and potential for life. Future missions aim to delve deeper into these questions, with plans for sample-return missions and potentially even human exploration in the coming decades. Understanding Mars better not only expands our knowledge of our solar system but also provides insights into the potential for life beyond Earth and the evolution of planetary systems in general. The challenges associated with reaching and sustaining life on Mars are immense, but the potential rewards are equally significant.

Summary

Mars, the fourth planet from the Sun, is a rocky, terrestrial planet with a thin, carbon dioxide-rich atmosphere. Its reddish hue, caused by iron oxide, is a distinctive feature. The planet exhibits striking geological formations, including the immense Olympus Mons and Valles Marineris. Despite its current cold and arid conditions, evidence suggests that Mars may have once had a warmer, wetter climate, potentially capable of supporting life. Ongoing and future missions aim to further investigate this possibility and unravel the mysteries of this fascinating planet.

FAQs

1. What is the distance between Mars and the Sun? The average distance between Mars and the Sun is approximately 228 million kilometers (142 million miles). 2. How long is a day on Mars? A Martian day (sol) is slightly longer than an Earth day, lasting about 24.6 hours. 3. How long is a year on Mars? A Martian year is significantly longer than an Earth year, lasting about 687 Earth days. 4. Does Mars have moons? Yes, Mars has two small, irregularly shaped moons: Phobos and Deimos. 5. What are the main challenges for human exploration of Mars? Challenges include the long travel time, the harsh Martian environment (radiation, low temperatures, thin atmosphere), the need for life support systems, and the psychological impact of long-duration space travel.
