one of the guiding thoughts throughout this work is that g w f hegel is the philosopher of the modern age that subsequent phil osophers whether or not they have read his works must take their stand in relation to hegel my purpose is not only to present hegel but to show that his influence has been felt for some time even though his presence has not been explicitly acknowledged in spite of a recent revival in heglian scholarship the history of philosophy in the english speaking world is generally obscured by a period of darkness between kant and the early inquiries of russell and frege a place is assigned to mill and bentham but even today very few anglo saxon philosophers would be prepared to recognise marx as a philosopher although it is widely held that marx was in some way influenced by hegel which is probably a good reason for not paying too much attention to the latter at best an understand ing of hegel is relevant to an understanding of marx but it is not considered that hegel made a significant contribution to the main stream of western philosophy from descartes onwards and it is assumed that he is of little relevance to the linguistic revolution pioneered by wittgenstein ryle and austin

so much technology works not by good design or by being a good fit to purpose but because people make it work because they have to for some reason we humans are incredibly creative and resourceful when it comes to getting something done there are numerous stories we could all tell of the ingenious work arounds we ve developed to make something do what we want it to or the enormous amount of time we ve spent trying to find out how to make some technology work as we want e g trying to find out how to turn off auto editing commands in a word processing package when all we want is for it to do what we tell it a good example of this principle was what motivated me to switch from neural networks to the area of computer supported cooperative work cscw for my phd research i had undertaken a case study looking at the deployment of a multi million dollar health information system throughout a hospital network

this title outlines different approaches to problem based learning suggests reasons for its growth and details its use across all disciplines

the book originated in a series of lectures given at liverpool in 2013 to a group that included postgraduate and undergraduate students and staff of the physics department they followed from two very successful lectures given to the undergraduate physical society it seemed that there was a very large interest among the students in investigating the foundations of physics in a way that was never done in physics courses and was not available in books or other outlets however the idea was to create a framework in which students and interested staff could develop their own thinking relative to the ideas in the lectures so it was important to create both conceptual and mathematical structures on the issues that are important at this level the book has the right sort of technical content to allow for this development but doesn t lose itself in excessive details the ideal use for this book would be on postgraduate courses where students would be encouraged to think about the foundations in a way that is well beyond the superficial however a course on aspects of this material would also be valuable at the undergraduate level where students could be stimulated into believing that creative thinking could solve the problems that emerge when we confront foundational problems

Bromination of Anisole: A Detailed Exploration

Introduction: Aromatic electrophilic substitution reactions are fundamental processes in organic chemistry, allowing for the modification of aromatic rings with various functional groups. One such reaction is the bromination of anisole, a reaction where a bromine atom is introduced onto the aromatic ring of anisole (methoxybenzene). This reaction serves as an excellent example of how the presence of activating and directing groups influences the regioselectivity (position of substitution) of electrophilic aromatic substitution. Understanding this reaction illuminates key concepts in reaction mechanisms and the interplay between structure and reactivity. This article will delve into the mechanism, reaction conditions, regioselectivity, and practical applications of anisole bromination. 1. The Structure of Anisole and its Reactivity: Anisole, with the formula C_7H_8O, possesses a methoxy (-OCH_3) group attached to a benzene ring. The methoxy group is an activating group, meaning it increases the electron density of the benzene ring, making it more susceptible to electrophilic attack. This activation is due to the resonance effect of the lone pair of electrons on the oxygen atom, which can delocalize into the benzene ring, creating electron-rich positions ortho and para to the methoxy group. 2. The Electrophilic Brominating Agent: Bromination of anisole typically employs molecular bromine (Br_2) as the electrophile. However, Br_2 is not a strong enough electrophile on its own to readily react with the aromatic ring. Therefore, a Lewis acid catalyst, such as iron(III) bromide ($FeBr_3$) or aluminum bromide ($AlBr_3$), is necessary. The Lewis acid polarizes the Br-Br bond, making one bromine atom more electrophilic and thus facilitating the attack on the aromatic ring. The catalyst forms a complex with bromine, creating a stronger electrophile, Br^+. 3. Reaction Mechanism: The bromination of anisole follows a two-step electrophilic aromatic substitution mechanism: Step 1: Electrophilic Attack: The electrophilic bromine species (Br^+) attacks the electron-rich benzene ring of anisole, leading to the formation of a resonance-stabilized carbocation intermediate (arenium ion). This intermediate is crucial; its stability directly dictates the reaction's regioselectivity. The positive charge in the arenium ion is delocalized across the ring, but it is most stable at the ortho and para positions due to the resonance stabilization provided by the methoxy group. Step 2: Deprotonation: A base (often Br^-, formed in the previous step) abstracts a proton from the arenium ion, restoring aromaticity and resulting in the formation of brominated anisole. This step completes the substitution reaction. 4. Regioselectivity: Ortho and Para Bromination: The strong activating and ortho/para directing nature of the methoxy group significantly influences the regioselectivity of the reaction. The major products are ortho-bromoanisole and para-bromoanisole. The para isomer is usually the major product due to steric hindrance at the ortho positions. The methoxy group's electron-donating capacity stabilizes the arenium ion intermediate more effectively when the bromine is in the para position, compared to the ortho position. 5. Reaction Conditions and Practical Considerations: The reaction is typically carried out at room temperature or slightly elevated temperatures in a suitable solvent, such as dichloromethane or acetic acid. The use of excess bromine ensures complete conversion of anisole. The reaction mixture needs to be protected from light as bromine is light sensitive. Workup involves quenching the reaction with water or aqueous sodium thiosulfate to remove excess bromine and extraction of the brominated anisoles. Purification techniques like distillation or recrystallization can be employed to separate the ortho and para isomers. 6. Applications of Brominated Anisoles: Brominated anisoles find applications in various fields, including: Synthesis of pharmaceuticals: They serve as intermediates in the synthesis of various pharmaceuticals and bioactive compounds. Production of agrochemicals: Some

brominated anisoles exhibit pesticidal or herbicidal properties. Dye synthesis: They can be employed as building blocks for the preparation of specific dyes. Materials science: They could be used as monomers in the synthesis of polymers or other functional materials. Summary: The bromination of anisole is a classic example of electrophilic aromatic substitution, clearly showcasing the influence of activating and directing groups on reaction regioselectivity. The reaction mechanism involves a two-step process: electrophilic attack leading to a resonance-stabilized arenium ion intermediate, followed by deprotonation to restore aromaticity. The methoxy group's strong activating nature directs the bromination primarily to the ortho and para positions, with the para isomer typically dominating due to steric factors. The brominated anisoles produced find applications in various fields, highlighting their importance in organic synthesis and beyond. Frequently Asked Questions (FAQs): 1. Why is a Lewis acid catalyst needed for the bromination of anisole? The Lewis acid polarizes the Br-Br bond, generating a stronger electrophile capable of attacking the relatively less reactive aromatic ring of anisole. 2. What is the major product of the bromination of anisole? The major product is usually para-bromoanisole due to less steric hindrance compared to the ortho isomer. 3. Can we brominate anisole without a catalyst? It is significantly slower and less efficient without a catalyst; the reaction may not proceed to a significant extent. 4. How can we separate the ortho- and para-bromoanisoles? Techniques like column chromatography or fractional distillation can be used, exploiting the differences in their boiling points or polarities. 5. What safety precautions should be taken during the bromination of anisole? Bromine is corrosive and toxic; appropriate personal protective equipment (PPE), including gloves, goggles, and a well-ventilated area, must be used. The reaction should be carried out under a fume hood.
